

Configuring Data Source Connections locally and remote

With complex networks, in some situations, ip addresses or other connection configuration cvariables can differ between authoring and publishing systems.

For example, my Desktop machine is connected through a VPN to my Tableau Server. For my local machine, the IP address for a data source is A and for the Server it is B. When i Publish i cannot access the data source directly.

[Stanley McLenna](#) mentioned this in his issue [Re: Publish Different Connection Parameters](#)
