

Only Relevant Values on Secondary Data Source

It would be nice if when you blend two data sources, you could have the option to show "Only Relevant Values" on filters used from the secondary data source. As it is right now (version 8) if you add filters from a secondary data source, you can not cascade the filters based on what the user selects from one filter to the other - this is only because the filters are from the secondary data source. Sometimes the list of values can be very large and confusing to the end user to select values that are not relevant.
