Mouse control of navigation on mapping views (Released in 9.3)

It would be great if a user could drag the centre of a map view around, and zoom with the scroll wheels of the mouse. Currently the only way to zoom is to select data points that happen to give you the level of zoom you want, which I'm finding does not occur very often.

Google maps is a good example of this functionality in action.

I'd also like an extension of this, that there is a filter applied so that at different zoom levels, different data points are displayed. e.g. Aggregated up into countries but following a zoom in to a certain range, the countries split into cities.
