Dynamic Center Point for Diverging Color Palette

We want to be able to dynamically set the center point of a diverging color palette from a measure in our data. For example, we have a bar chart with the color of the bars using a diverging color palette with the center hard coded at a threshold value of .80; when the value of the bars are under the threshold value of .80 the color is red, and if the value of the bars are over it then the color is green. It would be very beneficial if we didn't have to hard code the center point for the threshold and could make it dynamic similar to how you are able to dynamically use a measure value to dynamically set a reference line.
