Hierarchical Filtering

Idea:
- Extend the show relevant values function on quick filters to allow users to select which filters are relevant to the filter we want to have "relevant values displayed on"

Example:
- I have the following 4 filters on a dashboard:
  * Sector (Europe, Americas, Asia, etc...)
  * Country (United Kingdom, United States, Russia, etc...)
  * Year (2015, 2014, 2013, etc...)
  * Business Category (Furniture, Technology, Clothes, etc...)

I would like the values shown in the Country filter to refresh to show only the relevant values when the Sector filter is changed, however I don't want the Year or the Business Category filters to cause the filter to refresh.

Reasoning:
- This functionality can reduce the number of queries that run when a filter is changed. If I need to utilize "relevant values" for a filter it is taking into consideration all of the filters on the dashboard. So when I change any of the filters it has to refresh that filter, when in reality I only need it to refresh the values when 1 filter is changed not all of them.
- Adding this feature would allow for better performance in situations where I have 2 or three sets of hierarchical filters. Only refreshing the necessary filters reduces the number of queries being run in this situation and can have a significant performance impact in extreme cases.

Apologies if this is a duplicate, I was unable to find this idea through searching the ideas list.
