

# Allow custom administrative views in Tableau Online

---

Currently the Status page for Tableau Online presents an embedded workbook with pre-defined filters which allow you to view traffic, actions, tasks etc. To improve an admin's ability to monitor the Tableau Online environment, we need the ability to customize these views:

1) Permit remembering frequent filter values via a method such as the "Remember my changes" feature found on other workbooks.

(One useful example is in the Background Tasks tab: one might want a different timeframe or task duration other than 1800 seconds)

2) Allow administrators to copy/modify the Status visualization workbook and re-publish for their own site's usage.

3) Allow direct access to the Postgres data (secured to the site) such as is possible with Tableau Server. This correlates directly with #2 above.
