Allow Salesforce connector to pull calculated fields - formulas and roll-up summaries

With the Tableau connector to Salesforce.com, it currently does not allow visibility to any data fields that are formula fields or roll-up summaries. This is making it very painful, as my company has a lot of business logic built into formulas, so I basically have to re-create that logic within Tableau. And moving forward, now if we make any changes to a formula in Salesforce, that change needs to be duplicated in Tableau. It would be MUCH simpler if Tableau could pull these fields directly from Salesforce!
