

# Tableau Prep - allow more than 10 resulting fields from splits

---

I hit a standstill recently because I had a text field that had 40 or more values in a single field separated by a delimiter. I wanted to split and then pivot the values, but no matter what kind of Split I tried (Automatic or Custom > All Fields), the split only resulted in 10 fields. I notice that 10 is the maximum on the drop-down if I were to select a value for first or last. I know I could write 40+ calculations (e.g. `SPLIT([Field], "|", 1)`, `SPLIT([Field], "|", 2)`) but what a pain! (and I had 4 such fields, so 160+ calculations altogether - no thanks!)

Please allow more than 10 fields to result from the Split. I know I'm going to hit this again at the worst possible time when I have to have data clean and ready for someone

[Marked as released for 2019.1.3, the Automatic or Custom > All fields now handles 150 splits - Jonathan]
