

# Tableau Server API - Enhance for OAuth

---

It would be great to enhance the Tableau Server API to be able to embed credentials for OAuth. This is an important enhancement for any type of enterprise type implementation as manual migration between sites and servers is inefficient and error prone. Having the server API enhanced to more fully reflect and cover the tasks necessary to cover the required automation is necessary to make this a more fully enterprise product. In the case of our implementation we have data sources which use Denodo for which you have kindly created a native connector; however, unless you enhance the API to cover OAuth we do not feel comfortable leveraging these connectors because it would require a step backwards from automation to manual publishing and migration.
