

# Dashboard Watermark Draft Image

---

Automate the process of adding background image on dashboards. In today's version you can add Background images that you display underneath your data in order to add more context to the marks in the view. When you add a background image to the view, you need to specify a coordinate system by mapping both the X and Y axes to the values of fields in your database. This means images are very much specific to the dashboard, it is easier and productive for the user to add the image. However, there is a need to have images added to multiple dashboards. Such as Draft on all dashboard in QA and not ready for production. This allows the end users quick realization that this is not a production dashboard. Example below was created to use on our QA dashboards so the end user know this is not production data.

Thank you
